VSL has developed a new anchorage designed to satisfy the increasing expectations of the construction industry. The VSL GC type anchorage is an evolution optimizing new requirements with well proven materials while maximizing cost effectiveness.

The result is:
- lighter components
- ease of handling and placing
- fatigue resistance according to international guidelines and standards

The challenge for the VSL R&D Department was to further develop the EC and SC anchorage systems and to enhance the market friendliness. VSL has a long tradition in developing post-tensioning: revolutionary in 1966 as the first with strands, later on, in 1974 and 1992 with the introduction of casting (EC) and composite material (CS), and finally today with the GC System.

The GC consists of standardized anchorage units using up to thirty-seven 15 mm (0.6”) diameter strands and can be used with both steel or plastic PT-PLUS® ducts. Equipped with an additional retainer plate, the GC anchorage can also be used as a dead-end anchorage. It can be used for couplers and external cables.

The VSL GC System is compatible with ETAG (European Technical Approval Guidelines) and other state approval requirements. It has also been tested at cryogenic temperatures for its use in LNG/LPG tanks.
Technical data and characteristics

Strand properties

<table>
<thead>
<tr>
<th>Strand type</th>
<th>15 mm (0.6&quot;)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>

</tbody>
</table>

¹ The dimensions given are according our ETAG documents. Bigger diameters are possible
² VSL PT-PLUS® ducts for 3 and 4 strands are not available
³ Dimensions are subject to modification

Duct spacing and cover

In determining minimum spacings and concrete cover requirements, reference should be made to applicable standards and recommendations.

PT-PLUS® plastic duct with protection shell

VSL Protection Shells are recommended to be fixed on the duct at tendon supports for tendon radii \( R \leq 2 \ R_{\text{min}} \) (see next page).

PT-PLUS® duct coupler
– Half-shell
– Clamp
Technical data and characteristics

Stressing anchorage VSL type GC

Grout and local zone reinforcement are not shown. Spirals and/or rectangular stirrups are, however, required to control local zone stresses. Please contact the nearest VSL representative.

Dimensions in mm Subject to modification

* These castings have no trumpet

Max. prestressing force may be applied when concrete reaches 80% of its nominal strength. Max. prestressing force is 75% of min. tendon breaking load (temporary overstressing to 80%).

Where PT-PLUS® plastic ducts are used the trumpets for the GC have short, profiled extensions for PT-PLUS® coupling.

Friction

The following values may be assumed when using the equation $P_x = P_0 \cdot e^{\mu (\Delta \varphi + \Delta \phi x)}$

<table>
<thead>
<tr>
<th>Range</th>
<th>Recommended value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Steel duct</td>
<td>$\mu = 0.16$ to $0.20$, $\Delta \varphi = 0.004$ to $0.008 \text{ m}^{-1}$</td>
</tr>
<tr>
<td>PT-PLUS® plastic duct</td>
<td>$\mu = 0.10$ to $0.14$, $\Delta \varphi = 0.005$ to $0.012 \text{ m}^{-1}$</td>
</tr>
</tbody>
</table>

Minimum radius of tendon curvature and minimum tangent length

$R_{\text{min}} = 3 \times \sqrt{F_{pk} \text{ [MN]}} \geq 2.5 \text{ m}$

$L_{\text{min}} = 0.8 \text{ m for } F_{pk} \leq 2 \text{ MN}$

$L_{\text{min}} = 1.0 \text{ m for } F_{pk} > 2 \text{ MN}$

$L_{\text{min}} \leq 7 \text{ MN}$

$L_{\text{min}} = 1.5 \text{ m for } F_{pk} \geq 7 \text{ MN}$
The GC anchorage system has gained worldwide acceptance for many projects. In addition to its ease of handlings, customers particularly appreciate its compatibility with international standards and guidelines.
